

Materials Design and Characterization Laboratory (MDCL)

The MDCL was established as the third research facility of the Institute for Solid State Physics (ISSP) when the latter was reorganized in May 1996. Its aim is to promote material science with an emphasis on the “DSC cycle”, where DSC stands for design, synthesis and characterization, three processes for developing new materials.

The MDCL consists of two sections, Materials Design (MD) section and Materials Synthesis and Characterization (MSC) section. The Supercomputer Center of the ISSP (SCC-ISSP) is placed in the MD section, while in the MSC section there are six laboratories for joint use; Materials Synthesis Laboratory, Chemical Analysis Laboratory, X-ray Diffraction Laboratory, Electron Microscope Laboratory, Electromagnetic Measurement Laboratory, and Spectroscopy Laboratory.

Almost all the facilities of the MDCL are open to scientists in Japan through the User Programs conducted by two steering committees of the MDCL. One is the steering committee of the SCC-ISSP, under which the Supercomputer Project Advisory Committee is placed for reviewing proposals. The other is the steering committee of the MSC facilities. More than half of the members of these committees are from the outside of ISSP.

PREFACE

The Supercomputer Center (SCC) is a part of the Materials Design and Characterization Laboratory (MDCL) of ISSP. Its mission is to serve the whole community of computational condensed-matter physics of Japan providing it with high performance computing environment. In particular, the SCC selectively promotes and supports large-scale computations. For this purpose, the SCC invites proposals for supercomputer-aided research projects and hosts the Steering Committee, as mentioned below, that evaluates the proposals.

The ISSP supercomputer system consists of three subsystems: System A, which is intended for a parallel computation with relatively smaller number of nodes connected tightly, and System B, which is intended for more nodes with relatively loose connections. In July, 2010, the SCC replaced the two supercomputer subsystems. The current system B is SGI Altix ICE 8400EX, which consists of 30 racks or 15360 cores whereas the system A is NEC SX-9, which consists of 4 nodes or 64 cpus. They have totally 200 TFlops. System C - FUJITSU PRIMEHPC FX10 was installed in April, 2013. It is highly compatible with K computer, the largest supercomputer in Japan. System C consists of 384 nodes, and each node has 1 SPARC64TM IXfx CPU (16 cores) and 32 GB of memory. The total system achieves 90.8 TFlops theoretical peak performance.

The hardware administration is not the only function of the SCC. The ISSP started hosting Computational Materials Science Initiative (CMSI), a new activity of promoting materials science study with next-generation parallel supercomputing. This activity is financially supported by the MEXT HPCI strategic program, and in CMSI, a number of major Japanese research institutes in various branches of materials science are involved. The SCC supports the activities of CMSI as its major mission.

All staff members of university faculties or public research institutes in Japan are invited to propose research projects. The proposals are evaluated by the Steering Committee of SCC. Pre-reviewing is done by the Supercomputer Project Advisory Committee. In school year 2013 totally 245 projects were approved for ISSP joint research projects and 16 for CMSI projects.

The ISSP joint research projects are roughly classified into the following three (the number of projects approved):

- First-Principles Calculation of Materials Properties (107)
- Strongly Correlated Quantum Systems (30)
- Cooperative Phenomena in Complex, Macroscopic Systems (86)

All the three involve both methodology of computation and its applications. The results of the projects are reported in the present volume of 'Activity Report 2013' of the SCC. Every year 3-4 projects are selected for "invited papers" and published at the beginning of the volume. This year's invited papers are the following three:

"One-hundred-million-atom electronic structure calculations on the K computer",
Takeo HOSHI

"Strong correlation of electrons studied by computational approaches—Physics of superconductors and topological phases",
Shiro SAKAI, Takahiro MISAWA, Youhei YAMAJI, Mayuru KURITA, and Masatoshi IMADA

"Coarse-Grained Simulation of Surfactant Membrane",
Hayato SHIBA and Hiroshi NOGUCHI

We hope this volume will give you a good overview on recent activities in computational condensed matter physics in Japan.

May 19, 2014

Hiroshi Noguchi
(Chairman of the steering committee, SCC, ISSP)

CONTENTS

PREFACE

1 OUTLINE	1
1.1 Supercomputer System	1
1.2 Project Proposals	1
1.3 Committees	3
1.4 Staffs	6
2 STATISTICS OF FISCAL YEAR 2012	7
2.1 System Statistics	7
2.2 Queue, Job, and User Statistics	7
3 RESEARCH REPORTS	13
3.1 Invited Articles	13
3.2 First-Principles Calculation of Material Properties	43
3.3 Strongly Correlated Quantum Systems	139
3.4 Cooperative Phenomena in Complex Macroscopic Systems	171
3.5 CMSI projects	253
4 PUBLICATION LIST	281
ISSP Joint Research Projects	283
CMSI Projects	316
Doctor Theses	321
Master Theses	322
